Abstract:

Much work on the performance of Web proxy caching has focused on high-level such as hit rates, but has ignored low level details such as "cookies", aborted connections, and persistent connections between clients and proxies as well as proxies and servers. These details have a strong impact on performance, particularly in heterogeneous bandwidth environments where network speeds between client proxies are significantly different than speeds between proxies and servers. Through detailed simulations the latency and bandwidth effects of Web proxy caching in such environments. We drive our simulations with packet traces from two scenarios: clients connected through slow dialup modems to a commercial ISP, and clients on a fast LAN in an industrial research lab. We present three main results. First, persistent connections at the proxy can improve latency much more than simply caching Web data. Second, aborted connections can waste more bandwidth than that caching data. Third, cookies can dramatically reduce hit rates by making many documents effectively uncacheable.

41 [Defending against an Internet-based attack on the physical world](#)

Simon Byers, Aviel D. Rubin, David Kormann

November 2002 **Proceedings of the 2002 ACM workshop on Privacy in the Electronic Society**

Full text available:  pdf(201.19 KB) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

We discuss the dangers that scalable Internet functionality may present to the real world, focusing on a simple yet impactful attack that we believe may occur quite soon. We offer and critique various solutions to this class of attack and hope to provide a warning to the Internet community of what is currently possible. The attack is, to some degree, a consequence of the availability of private information on the Web, and the increase in the amount of personal information that users must reveal ...

Robert H. Deng, Jianying Zhou, Feng Bao

November 2002 **Proceedings of the 9th ACM conference on Computer and communications security**

Full text available:  pdf(266.04 KB) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

The route optimization operation in Mobile IP Version 6 (MIPv6) allows direct routing from any correspondent node to any mobile node and thus eliminates the problem of "triangle routing" present in the base Mobile IP Version 4 (MIPv4) protocol. Route optimization, however, requires that a mobile node constantly inform its correspondent nodes about its new care-of addresses by sending them binding update messages. Unauthenticated or

malicious binding updates open the door for intruders to perform ...

We present an effective method of eliminating unsolicited electronic mail (so-called *spam*) and discuss its publicly accessible prototype implementation. A subscriber to our system is able to obtain an unlimited number of aliases of his/her permanent (protected) E-Mail address to be handed out to parties willing to communicate with the subscriber. It is also possible to set up publishable aliases, which can be used by human correspondents to contact the subscriber, while being useless to h ...

October 2004 **Proceedings of the 4th ACM SIGCOMM conference on Internet measurement**

Full text available:  [pdf\(405.42 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Current intrusion detection and prevention systems seek to detect a wide class of network intrusions (e.g., DoS attacks, worms, port scans) at network vantage points. Unfortunately, all the IDS systems we know of keep per-connection or per-flow state. Thus it is hardly surprising that IDS systems (other than signature detection mechanisms) have not scaled to multi-gigabit speeds. By contrast, note that both router lookups and fair queuing have scaled to high speeds using *aggregation* ...
